

#### ABSTRACT OF THE DISCLOSURE

This invention has as its object to generate print data using minimum resources in a terminal. A browser controller acquires a predetermined Web page from an Internet print server, and inputs the URL of a Web page to be printed and a print mode on that page. 5 Printer information is transmitted to the server together with the input information. The server reads a Web page specified by the received URL, generates print data in a format that the printer can print in accordance with the printer information and print mode, and transmits that print data to the browser controller. 10 The browser controller transmits the print data to the printer to print it out while receiving the print data.
